WATTWISE AI

Lean Canvas · Smart Energy Consumption Pattern & Anomaly Discovery

PROBLEM	SOLUTION	UNIQUE VALUE PROPOSITION	UNFAIR ADVANTAGE	CUSTOMER SEGMENTS
• Energy users may not notice unusual consumption patterns. • Manual review of hourly readings is time-consuming. • Small users often lack accessible, explainable usage insights.	• Dashboard for hourly consumption trends. • Isolation Forest flags unusual readings. • CSV upload and downloadable scored records.	Turn raw energy readings into understandable signals for review — a lightweight, student-built prototype for smarter energy awareness.	Initial advantage is a focused, low-cost prototype and clear workflow. No defensible proprietary advantage has been established yet.	• Households and small facilities with meter exports. • Campus/facility managers. • Student energy/sustainability projects.
EXISTING ALTERNATIVES	**KEY METRICS**	**HIGH-LEVEL CONCEPT**	**CHANNELS**	**EARLY ADOPTERS**
• Manual spreadsheet review. • Utility portals and smart-meter dashboards. • Commercial energy-management systems.	• Valid readings processed. • Anomaly review rate. • False-positive rate after human review. • Time to investigate an event.	“A lightweight energy-insight dashboard with unsupervised anomaly detection.”	• University sustainability clubs. • Campus/facility pilot. • Student project showcases and demos.	• Campus labs/facilities with exported meter data. • Sustainability-minded households willing to test CSV workflows.

COST STRUCTURE	REVENUE STREAMS
Development time; hosting/domain if deployed; data preparation; model evaluation; maintenance and privacy/security review.	Potential future options: freemium dashboard, facility subscription, or sustainability analytics service. Not validated; prototype is not currently monetized.

SDG alignment: SDG 7 — Affordable and Clean Energy; SDG 12 — Responsible Consumption and Production. Current prototype uses synthetic data; field impact and business viability remain unvalidated.
